Project 2 – Exploratory Data Analysis (EDA) of Two Data Sets ALY 6000

Project Instructions

In this two-part project, you will explore core functions within the set of libraries known as the tidyverse.

Note: Utilize the file **project2_tests.R** with the code below to run a series of tests (not comprehensive) on your code. Any failed test signals that something is wrong with the results or that you have not utilized the specified variable names.

```
p_load(testthat)
#testthat::test_file("project2_tests.R")
```

Setting Up Your Project

- Download and open the R Markdown file "LastName-FirstName-Project2.Rmd." Replace LastName and FirstName with your own last name and first name.
- 2. Run the following code at the very top of the file. This will clear out the environment each time you run your entire code and prevent past actions from interfering with current work.

```
cat("\014") # clears console
rm(list = ls()) # clears global environment
try(dev.off(dev.list()["RStudioGD"]), silent = TRUE) # clears plots
try(p_unload(p_loaded(), character.only = TRUE), silent = TRUE) #
clears packages
options(scipen = 100) # disables scientific notation for entire R
session
```

- 3. Download the cheat sheets for the tidyr and dplyr packages for quick reference. You can access them from the help menu in RStudio.
- 4. Install the *pacman* package. This is a simple, user-friendly package that makes installing and loading other packages a one-line process.

```
# You should do this line only once in the entire course.
install.packages("pacman")

# Once you have done the install line, the following line is what you
will always need to do to utilize the pacman package and other libraries
in R
library(pacman)
p_load(testthat)
p_load(tidyverse)
p_load(ggplot2)
```

5. For each question, write the code to answer it within its own cell in the file. All outputs and visualizations should appear underneath the cell.

Assignment Part 1

Data can measure many things. Countries, for example, can be assessed against a variety of metrics. In addition to the gross domestic product (GDP) of a given country, researchers consider other data points in assessing the quality of life across the globe. To understand how data can be wrangled to measure freedom, trust, and other measures of human life, complete the following steps. The assignment displays the expected outcome after each step.

1. Read the data set **2015.csv** and store it in a variable called **data_2015**. You can test that you loaded it correctly with the code utilizing the head function below.

```
head(data_2015)
# A tibble: 6 × 12
  Country Region Happi... Happi... Stand... Econo... Family Healt... 5
Freedom Trust...<sup>6</sup>
                   <dbl>
                           <dbl>
                                           <dbl> <dbl>
  <chr>
          <chr>
                                  <dbl>
                                                         <dbl>

                                                         0.889
       0.414
0.642
# ... with 2 more variables: Generosity <dbl>, `Dystopia Residual` <dbl>,
and
   abbreviated variable names ¹`Happiness Rank`, ²`Happiness Score`,
   3`Standard Error`, 4`Economy (GDP per Capita)`,
   5`Health (Life Expectancy)`, 6`Trust (Government Corruption)`
```

2. Use the function **names** to produce the column names for your data set.

```
names(data_2015)

[1] "Country" "Region"

[3] "Happiness Rank" "Happiness Score"

[5] "Standard Error" "Economy (GDP per Capita)"

[7] "Family" "Health (Life Expectancy)"
```

```
[9] "Freedom" "Trust (Government Corruption)"
[11] "Generosity" "Dystopia Residual"
```

- 3. Use the **view** function to view the data set in a separate tab.
- 4. Use the **glimpse** function to view your data set in another configuration.

```
glimpse(data_2015)
```

5. Use **p_load** to install the **janitor** package. Janitor has a function called **clean_names** that can be given a data frame to make the names more R friendly. Be sure to store the resulting converted data frame in a variable.

```
p_load(janitor)
data_2015 <- clean_names(data_2015)
data_2015</pre>
```

6. Select from the data set the **country**, **region**, **happiness_score**, and **freedom columns**. Store this new table as **happy_df**.

```
# A tibble: 158 × 4
   country
               region

11. Summarize the **happy_df** data set. Your summary should contain the **mean** happiness_score in a column called **mean_happiness**, the **max** happiness_score in a column called **max_happiness**, the **mean** freedom in a column called **mean_freedom**, and the **max** freedom in a column called **max_freedom**. Store the resulting table as **happy_summary**.

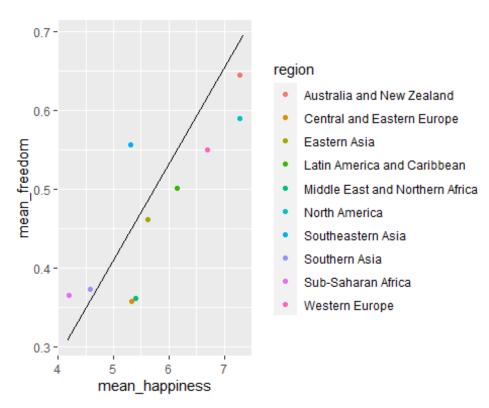

12. Group the **happy_df** data set by region. Run a summary that provides the number of countries in each region in a column called **country_count**, the **mean** happiness for each region in a column called **mean_happiness**, and the **mean** freedom of each region in a column called **mean_freedom**. Store your resulting table in a variable called **regional_stats_df**.

# A tinble: 10 × 4		
region	country_count	mean_happiness
mean_freedom		
<chr></chr>	<int></int>	<dbl></dbl>
<dbl></dbl>	2	7.00
1 Australia and New Zealand	2	7.28
0.645	20	F 22
2 Central and Eastern Europe	29	5.33
0.358		5 63
3 Eastern Asia	6	5.63
0.462	22	C 14
4 Latin America and Caribbean	22	6.14
0.502	20	F 44
5 Middle East and Northern Africa	20	5.41
0.362	2	7 27
6 North America	2	7.27
0.590	0	F 22
7 Southeastern Asia	9	5.32
0.557	7	4 50
8 Southern Asia	7	4.58
0.373	40	4 20
9 Sub-Saharan Africa	40	4.20
0.366	24	6.60
10 Western Europe	21	6.69
0.550		

13. [Challenge Problem] Compare the average gdp per capita of the ten *least* happy Western European countries with the ten *happiest* Sub-Saharan African countries. For testing, you can store the resulting data.frame or table as **gdp_df**.

```
# A tibble: 1 × 2
europe_gdp africa_gdp
```

14. [Challenge problem] From your **regional_stats_df**, create a scatterplot of mean_happiness vs. mean_freedom. Draw a line segment from the smallest of these values to the largest.

Assignment Part 2

In Part Two of this R Project, you will analyze a data set of batting statistics from the 1986 Major League Baseball season. You will then draft a brief executive summary that corresponds to the data analysis. Details for both the data analysis and executive summary follow below.

- 1. Download the **baseball.csv** data set. data set that represents batting statistics from the 1986 Major League Baseball season. Read this data set in a **variable** called **baseball**.
- 2. Spend time with the data using various exploration functions to get a general feel for what you are working with. For more information on this data set and its various columns, see Baseball Reference's 1986 Major League Standard Batting.
- 3. Use the *class* function to discover the type of class represented in the **baseball** data set.

4. For each age, compute the following: the number of people at that age, the average number of home runs (HRs), the average number of hits, and the average number of runs scored. Store these computations in a variable called **age_stats_df**.

```
# A tibble: 24 × 5
    Age Count
                 HR
                         Н

13. For eligible players, create a histogram of batting average. Use a binwidth of .025 in your graph. The graph should be drawn in blue and filled in green.

14. Use the following code to create a ranking column of **eligible** players with regard to home runs (HRs). Store the result in **eligible_df**.

19. In a separate report, make a recommendation for the league most valuable player (MVP). Keep in mind that the dataset completely ignores pitchers. You can decide whether a pitcher should be eligible for the MVP. Base your decision on the data you have analyzed. You may choose to do additional analysis at your discretion. You should produce a concise, written executive summary that, in addition to the title page and citations, contains an introduction, presentation of written key findings supported by visualizations, and a conclusion that contains your recommendations as supported by the data. Your executive summary should adhere to basic APA guidelines.

Submitting to Canvas

When you are satisfied with your solution, take the following steps:

- 1. **Remove** any lines in your code with "include.packages" or "install.packages."
- 2. **Remove** any lines in your code that use the view function.
- 3. Submit two (2) files under the appropriate assignment in Canvas:
 - 1. Your R Markdown file named **LastName-FirstName-Project2.Rmd**.
 - 2. A PDF file of your four-page report titled **Lastname_Project2_Report.pdf**.

Your report should contain the following information formatted as specified below:

Title Page

Include your name, assignment title, and submission date

Introduction and Key Findings

Include an overview of the assignment and any findings

Conclusion/Recommendations

Include evidence-based recommendations and visualizations or direct presentation of tabular data

Works Cited

Include all sources, including YouTube videos, instruction materials, Google search results, and texts that informed your study of statistics and R

Your report should be as concise as possible while maintaining fluency. Your key findings will be strongest if supported by visualizations or direct presentation of tabular data.

Your summary must adhere to APA guidelines, including page numbers on each page (including the title page) in the upper right corner. See the following examples for <u>title pages</u>, <u>citations</u>, and <u>general APA formatting</u>.

Congratulations on completing your second project!
